TO MONITOR OR NOT TO MONITOR--DECISIONS IN THE RETRIEVAL OF
READING RESEARCH JOURNAL LITERATURE. ERIC/CRIER READING
REVIEW SERIES, VOLUME 1.

BY- SUMMERS, EDWARD G.

INDIANA UNIV., BLOOMINGTON, ERIC CH. ON READING

PUB DATE MAR 68

EDRS PRICE MF-\$0.25 HC-\$1.68 40P.

DESCRIPTORS- *READING RESEARCH, *RESEARCH REVIEWS
(PUBLICATIONS), SCHOLARLY JOURNALS, INFORMATION RETRIEVAL,
PERIODICALS, INFORMATION UTILIZATION, INFORMATION PROCESSING,
READING RESEARCH CENTER, UNIVERSITY OF CHICAGO,

THE DEVELOPMENT OF AN OBJECTIVE STRATEGY FOR THE
SELECTION OF JOURNAL LITERATURE IN THE RETRIEVAL OF READING
RESEARCH IS DESCRIBED. A FREQUENCY COUNT WAS MADE OF THE
ARTICLES APPEARING IN THE GRAY SUMMARIES OF READING RESEARCH
PUBLISHED ANNUALLY BY THE READING RESEARCH CENTER OF THE
UNIVERSITY OF CHICAGO. THE JOURNALS FOR THE PERIOD 1884 TO
1965-66 WERE RANKED IN TERMS OF PRODUCTIVE IMPORTANCE. LISTS
OF JOURNALS ARE SUGGESTED THAT WOULD SUPPLY THREE LEVELS OF
COVERAGE -- TOTAL COVERAGE, 50-PERCENT COVERAGE, AND
80-PERCENT COVERAGE. DECISION FACTORS OTHER THAN SHEER
QUANTITY OF PRODUCTION THAT MUST ENTER INTO THE SELECTION OF
JOURNALS TO INSURE ADEQUATE COVERAGE OF READING RESEARCH ARE
DISCUSSED. (AUTHOR)

To Monitor or Not to Monitor:
Decisions in the Retrieval of Reading
Research Journal Literature

Edward G. Summers
Indiana University

RE 001 166

The ERIC Clearinghouse on Retrieval of Information and Evaluation on Reading is a national clearinghouse which collects, organizes, analyzes, and disseminates significant research, information, and material on reading to teachers, administrators, researchers, and the public. ERIC/CRIER was established as a joint project of the International Reading Association and Indiana University in cooperation with the Educational Resources Information Center of USOE. The Clearinghouse is part of a comprehensive information system being developed for the field of education.

The ERIC/CRIER Reading Review Series has been created to disseminate the information analysis products of the Clearinghouse. Analysis of information can take place on a broad continuum ranging from comprehensive reviews of the state of the knowledge in a given area to bibliographies of citations on various topics. Four genres of documents appear in the Reading Review Series. The first type includes bibliographies, with descriptive abstracts, developed in areas of general interest. The second type consists of bibliographies of citations, or citations and abstracts, developed on more specific topics in reading. The third type provides short, interpretive papers which analyze specific topics in reading using the existing information collection. The final genre includes comprehensive state-of-the-art monographs which critically examine given topics in reading over an extended period of time.

To Monitor or Not to Monitor: Decisions in the Retrieval of Reading Research Journal Literature describes the development of an objective strategy for selection of journal literature in retrieval of reading research. A frequency count was made of the articles appearing in the Gray summaries of reading research published annually by the Reading Research Center of the University of Chicago. The journals for the period 1884 to 1965-66 were ranked in terms of productive importance. Lists of journals are suggested that would supply three levels of coverage: total coverage, 50% coverage, and 80% coverage. Decision factors other than sheer quantity of production that must enter into the selection of journals to insure adequate coverage of reading research are also discussed.

Several document corpora make up the Master File of materials which is organized for search and retrieval in the ERIC/CRIER Clearinghouse on Reading. The Gray Summaries comprise one segment of the file and consist of over 4,000 references from the published literature which report reading research. This material is an important link in the information and communication network for reading. A recent study by Summers⁽¹⁾ described the procedures followed in assembling the Gray bibliographies and transforming them for computer storage and retrieval. The study identified journals citing reading research and the network output in journal and article production across the total time span of the summaries - approximately 1884 to 1966. The statistics verify the rapidly expanding nature of information base in reading research. Journals were also classified into core, high frequency and peripheral publications based on the relative volume of article output over the time span tabulated.

One goal of ERIC/CRIER is the establishment of a surveillance system which will monitor the journal literature and continue to add important articles on reading research to the data base. The question of what journals should be monitored, out of the hundreds available to education, to insure acquisition of a substantial proportion of the reading research articles published becomes an extremely important one. The project using the Gray Summaries provides basic data which is helpful in establishing

(1) Edward G. Summers, Storing and Searching Reading Research by Computer, Final Report USOE Project CE-5-10-224. December, 1967.

the relative productive importance of journals and in making decisions on those which it would be most effective to monitor.

Pattern of Journal Citation in the Gray Summaries

A frequency count was made on the Gray Summaries for the period 1884 to 1966. The results were arrayed in five periods and are presented in Tables 1 through 5. Each table presents, in rank order, the most productive journals for each period and the number of articles reported by those journals. For each of the five periods the rank order list was first split between the values for the "most-cited" journals carrying approximately 50% of the articles and the "least-cited" journals carrying the remaining half. The results for the five periods are presented in Table 6. The statistics for each of the five periods follow a consistent pattern. The comparisons fall roughly into a 5% to 10%/90% to 95% division. Five to ten percent of the total number of journals identified reported approximately 50% of the articles while the other 50% was reported by the remaining ninety to ninety-five percent of the journals - depending on which period is being examined. For purposes of contrast Table 7 reports the results when the rank order list was split for the "most-cited" journals carrying approximately 80% of the articles and the "least-cited" journals carrying the remaining 20%. The statistics for each of the five periods again follow a consistent pattern. The comparisons fall roughly into a 23% to 29%/72% to 76% division. Twenty-three to twenty-nine percent of the total number of journals identified reported approximately 80% of the articles while 20% was reported by the remaining seventy-two to seventy-six percent of the journals - depending on which period is being examined.

Journal Coverage for the Individual and the Library

The results of the 50% and the 80% analyses are interesting and suggest a number of alternatives for both the individual attempting to sharpen his own personal monitoring system for acquisition of reading research or the information analysis center attempting to establish a viable monitoring and acquisition system. Of course the ideal approach for both would be to merely subscribe to all the journals identified in Table 5 and monitor them accordingly for relevant articles. With some surveillance of the overall literature to continue to add peripheral journals, almost total acquisition of the relevant material could be realized. However, this idealized approach is seldom possible, particularly when economics is a major factor. The individual, or the information analysis center operating in isolation, cannot afford the luxury of subscribing to the large number of journals which publish one or two articles every few years just to maintain complete coverage. The analysis of the relative productive importance of various journals does provide considerable help to the individual acting as his own small scale monitoring and retrieval service. As indicated in Table 6, subscription to just seven "most-cited" journals would enable the researcher to have at his fingertips better than 50% of the relevant published research literature on reading. By adding 26 journals to total the 33 indicated in Table 7 better than 80% of the literature would be available. Although the financial outlay to add subscriptions to bring the coverage up to 80% would be beyond the personal finances of most individuals, it would not be out of the ordinary for the researcher to expect his library to

TABLE 7
Values by 80% of articles

Period covered	Most cited		Least cited	
	Journals	Articles	Journals	Articles
1884 to 1925-26	12 (28.5%)	261 (80.0%)	30 (71.5%)	65 (20.0%)
1926-27 to 1935-36	26 (24.2%)	608 (80.5%)	81 (75.8%)	147 (19.5%)
1936-37 to 1945-46	26 (25.4%)	626 (80.2%)	76 (74.6%)	154 (19.8%)
1946-47 to 1955-56	28 (23.7%)	653 (80.2%)	90 (76.3%)	161 (19.8%)
1956-57 to 1965-66	33 (24.0%)	1194 (80.3%)	103 (76.0%)	290 (19.7%)

maintain subscriptions to the additional 26 core publications - or the total 33 for that matter. With this combination of library and individual resources the researcher would actually have access to the total documents, on a personal or loan basis, for a considerable amount of the published research literature in reading. The results of the analysis provide the individual with objective data on which to base his subscription decisions. They also enable him to communicate with the library on an objective basis in recommending establishment of subscriptions to maintain a useful basic collection on reading.

Journal Coverage in an Information Analysis Center

Establishing a monitoring and acquisition system for an information analysis center is another matter. Comprehensive coverage becomes extremely important but again is usually attainable only as economics permit. In producing bibliographies or state-of-the-art and review papers such coverage becomes almost mandatory. A major service would be performed by such a center by at least announcing those articles that would not appear in the 50% coverage maintained by the individual or even the 80% coverage provided him in concert with the library collection. Another factor also enters here. Even though the combined collection of the individual and the library might actually provide access to the total documents, the information analysis center helps bridge the gap between the documents and the user by providing the indispensable service of announcing, either on a current awareness basis or through bibliographic and review functions, the relevant articles which may be of interest. Most active professionals do not have the time or the resources to system-

atically maintain their own surveillance net, except in a small way, even though they might have access to the total document once it is identified for them. The information center performs an important adjunct role here in essence enabling the researcher to better use whatever collection he maintains individually or in cooperation with the library.

In light of the previous discussion it would seem that an information analysis center would want to maintain a complete monitoring and acquisition system if possible. The individual can monitor a small number of highly productive journals but the real service of such a center is in bringing the peripheral journal literature to his attention. The 80% level might be a compromise with total coverage and the 50% level represents a bare minimum standard. Even with the resources available to the analysis center that would perhaps not be available to the individual or library, few centers could operate economically as individual units on the total subscription basis. However, if centers with missions and subject areas falling into the same domain - such as the broad field of education - operate in concert then maximum use can be made of the highly expensive peripheral literature because there would be substantial probability that articles in the low frequency literature not of use in one center would be of use in another. Each of the ERIC units now needs a fairly precise definition of its core and peripheral literature. A central clearinghouse type arrangement can then engage in the subscription function and distribute journals and articles in accordance with the subject definitions of the separate units. A highly effective and valuable service to education could be accomplished within the economic

constraints now operating. Current exploratory research in progress within the ERIC system will examine the feasibility and operational aspects of such a concept. There is every likelihood that such a system will be implemented in the near future for the ERIC network.

Journal Coverage at the 80% Level

A number of factors in addition to sheer output have to be considered in selecting journals to be monitored for an effective surveillance program to cover the journal literature in any field. For example, the relative productive importance of various journals over time as well as at the instant the system is being established has to be considered. For purposes of illustration the following discussion considers the decisions to be made in establishing a monitoring and acquisitions system for reading research literature which would operate at the 80% level of coverage. Table 8 presents a composite of the core literature production, by periods, for the total time span covered by the Gray Summaries. The vertical column for each period indicates the core journals (those producing 80% of the articles reported) for that period and the number of articles published. Many of the journals produced articles in periods other than those marked but the volume was not of sufficient magnitude to classify them as core publications. The 65 core publications have been arrayed in seven categories. Category I includes those journals which have been listed as core publications for four or five of the periods. These publications would be essential in any listing of current core journals for reading. Journals in Category II, those listed as core for three decades, should also be included. The English Journal is in-

Journal	1884 to 1925-26	1926-27 to 1935-36	1936-37 to 1945-46	1946-47 to 1955-56	1956-57 to 1965-66
<u>Category VII cont'd.</u>					
51. Elementary English Review		35	47		
52. Chicago Schools Journal	8	6	6		
53. Psychological Monographs			10		
54. Rev. of Educational Research			8		
55. Teachers College Record	23	21	11		
56. J. of Higher Education		10	7		
57. Psychological Bulletin		8			
58. Univ. of Pittsburgh School of Education Journal		10			
59. Psychological Clinic	7	13			
60. Calif. J. of Elementary Education		6			
61. Calif. Quarterly of Secondary Ed.		8			
62. Childhood Education		9			
63. Educational Method		16			
64. Pedagogical Seminary	13				
65. Elementary School Teacher	11				

cluded in this category even though its publication during one of the periods was not high enough to warrant its being listed as core. Category III lists journals which have been core publications for the most recent two decades. Category IV lists journals which have been identified as the core productions for the most recent decade. Both categories should be included as current core publications for reading research.

Category V is an interesting category and illustrates the shift that takes place among journals in terms of relative productivity of articles. This category includes six journals which were core producers for three and four decades but whose volume was not of sufficient magnitude in the most recent decade to warrant classification as core. All six journals, however, were still producing reading articles in the most recent period and may have just had a low publication rate for the current decade or may be declining in overall productive importance. In any event, it would be wise to include them in a current listing of core journals so their production can be monitored to determine if they warrant future core status.

Category VI journals are those which had core production the fourth period but fell out of the core status in the most recent decade. Some of these journals produced articles the most recent decade and may also warrant monitoring to determine if their decline is temporary or will continue. Category VII includes those journals which were at one time of core status but have not achieved that level of productivity for the most recent two, three, and four decades. These publications may still produce an occasional article on reading but the volume of publication

is relatively low as compared to their previous output. They can definitely be classed as peripheral publications for the current period.

It would appear that the 47 journals in Categories I through IV would comprise a highly useful list of current core or most productive journals for reading research. Monitoring the publication of these journals would assure that 75-80 percent of the published research literature related to reading would be identified. Judicious selection of additional publications in Category VII, and from other high frequency and peripheral journals identified previously, would increase the probability substantially that the majority of relevant sources were being included. This core listing is compiled on the basis of volume of production for any one journal. Caution must be exercised in using it as the sole means of selecting important journals for reading research. The significance of the rank of the volume of publication for any one journal is relative to the volume of publication for all other journals tabulated during that period. Thus, lines of demarcation for the three categories - core, high frequency, and peripheral - are seldom completely absolute and many journals shifted in and out of these categories, based on their relative production, for the time period being tabulated.

In addition, the relative importance of some single articles from low frequency publications must be considered when identifying the important core journals. For example, the AERA Language Arts and Fine Arts Review, item 47 - Category III, had sufficient relative publication volume to classify it as core for one period, but not for the most recent decade. The Review is done on a three year cycle and has become one of

the most significant and useful reviews for reading research. However, if core journals were selected on the basis of publication volume alone the review would be omitted. Any listing of core publications should consider other criteria in addition to sheer volume of publication, and the low producing high frequency and peripheral literature should also be combed for the extremely significant occasional articles and reviews they can contribute.

It is interesting to note the nature and distribution of the 33 core publications identified for the most recent decade. They illustrate the diversity of interests involved and the interdisciplinary thrust of recent research efforts in reading. Journals from domains of education such as child development, administration, curriculum, and educational psychology are represented. Reports from areas such as psychology, vision, exceptionality, communication, library science, and counseling and guidance are also included. This diversity is illustrated further when looking beyond the core publications to high frequency and peripheral journals for the most recent decade. Many of these publications are of recent origin and will probably evolve as continuous core publications in future years. Another interesting phenomenon is the increasing volume of research being identified in journals published in other countries. The Alberta Journal of Educational Research, the Ontario Journal of Educational Research, and the British Journal of Educational Psychology were all classified as core. Other journals from other countries also appear as high frequency and peripheral publications.

Table 8 also illustrates one other important development relevant

to production of reading research. The International Reading Association started as a professional society during the middle fifties. The three journal publications of the Association, the Reading Teacher, the Journal of Reading (formerly the Journal of Developmental Reading) and the Reading Research Quarterly, reported 291 articles on reading research for 1956-57 to 1965-66. This represents approximately 25 percent of the total production of research articles for the ten year period. Thus, IRA has gradually assumed a major role in generating research literature in the field of reading.

Conclusions

As was previously pointed out, one important element in the Master File of materials making up the ERIC/CRIER data base consists of the research reports which have appeared in the published journal literature. It is essential that techniques be developed to insure that journal literature continues to be added to the data base in a systematic fashion. The most important question to be answered in developing an effective monitoring and acquisition program for the journal literature is, "What combination of journal titles should be monitored to insure adequate surveillance of the literature?" This report describes completed research on the Gray Summaries which is particularly helpful in providing an answer to this question. It is suggested that the degree of coverage may differ depending on purpose and the economics of the situation. Three possible levels of coverage are explored: total acquisition, acquisition at the 50% level, and acquisition at the 80% level. It is recommended that, ideally, an information analysis center should strive

for total coverage with the 50% and 80% levels being admissible alternatives. Decision factors other than pure quantity in selecting journals are explored and recommendations made as to what journals should be monitored to achieve the 80% level of coverage. Individuals, libraries, and information analysis centers could use the results of this project in establishing monitoring and acquisition programs on an objective basis.
